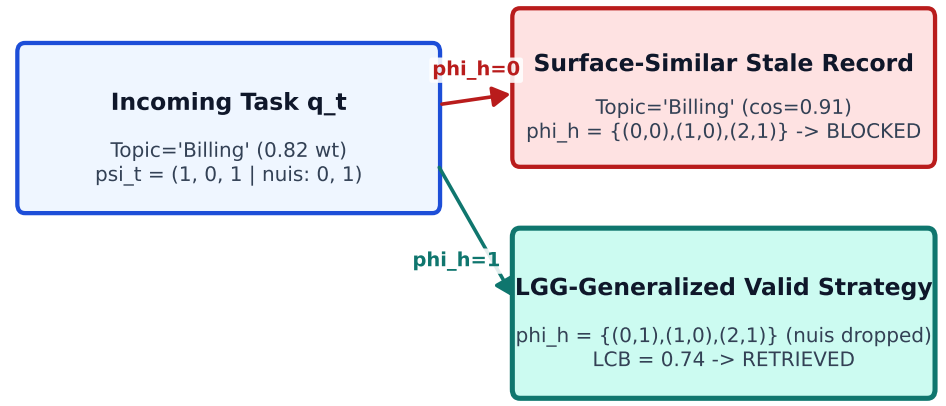
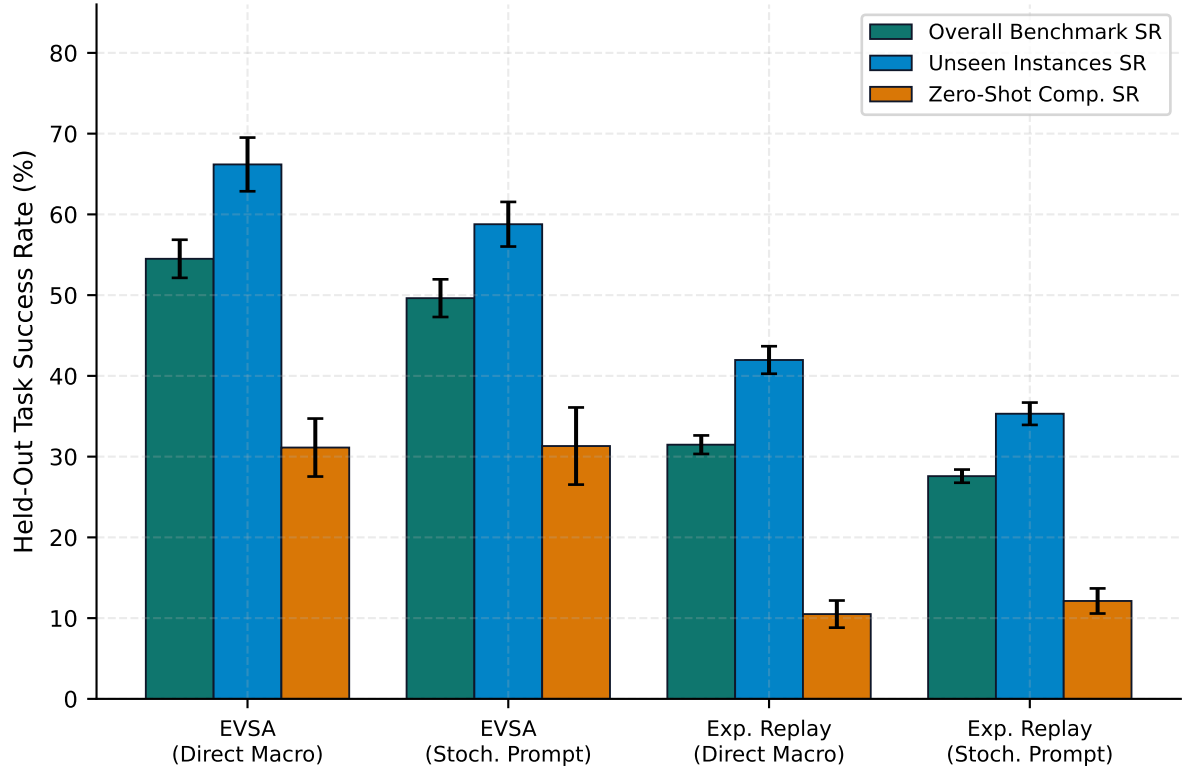
(a) Applicability Gate & LGG Nuisance Abstraction



U(h, q_t) = phi_h(psi_t) * I[LCB>=0.45] * [0.28 cos + 0.52 LCB + 0.20]

Blocks surface collisions & weak rules while Safe-LGG abstracts nuisance bits


(b) Execution-Channel Fairness Control (N = 20 Seeds, 95% CI)
